

## Fog lamps on with High beam Modification

- Remove the 4 bolts and drop the fuse block, locate the large connector on the right side.
- Locate the light green/black wire and cut as shown.
- Connect a new piece of wire to the half coming from the fuse box and ground the other end.
- The lights will work exactly as before except they will stay on when high beams are turned on.

PS: This can only be done if your fuse box has the light green/black wire.
